

Team Bway 2.0

Grading

1. Retegan Catalin-Cristian Team Leader 10
2. Sabadus Alexandru-Bogdan 10
3. Rusu Raul-Mihai 10
4. Ravasz Tamás 10
5. Scherer Serban-Edward 9

The part in which we had to create Diagrams(Use-Case Diagram, Sequence Diagram, Class Diagram, Database Diagram, Collaboration, Arhitecture Diagram) was split evenly between all teammates, then when we decided to do a Web App we split into two teams the Front-End Team(Raul and Alex and Edward(later in the project development)) and Back-End Team(Tamás and Catalin and Edward).

Back End we split the work like this, Catalin worked mostly with liquibase in the beginning of the development, after the status of the database became stable and had all the entities created and populated started helping with the new feature requests. Tamás created the classes and linked them to the ORM and he added most of the controller features. Edward helped the back-end team with developing classes and uploading/ downloading files and created the skeleton of the database we ended up using.

Raul lead the front-end team, he did the application structure on the front-end part and after that part was done, the team split by features: Raul did the Proposal and My conference features and Alex did the features that a normal user will have and because there were a lot of things to do in the front-end Edward helped the team by doing some of the design and doing the upload/download part for the front team too.

Overall the team worked together very well, we had some delays in the deadlines mostly from Edward, but the work was always done by the person it was assigned to and in the end we had most of the features in the end, because of the herculean effort of the front team in the last days of developing.
